Cryptography Lecture 16

Arkady Yerukhimovich

October 23, 2024

Outline

- 1 Lecture 15 Review
- 2 AES Review
- 3 Feistel Networks and DES (Chapters 6.2.2-6.2.4)
- 4 Building Collision-Resistant Hash Functions (Chapter 6.3.1)

Lecture 15 Review

- Review of exam and research project
- Blockciphers
- Confusion-Diffusion paradigm and the avalanche effect
- Substitution-Permutation Paradigm
- AES

Outline

- Lecture 15 Review
- 2 AES Review
- Feistel Networks and DES (Chapters 6.2.2-6.2.4)
- 4 Building Collision-Resistant Hash Functions (Chapter 6.3.1)

Advanced Encryption Standard (AES)

Developed by Vincent Rijmen and Joan Daemen

5/22

Arkady Yerukhimovich Cryptography October 23, 2024

- Developed by Vincent Rijmen and Joan Daemen
- Winner of NIST blockcipher competition in 2000

- Developed by Vincent Rijmen and Joan Daemen
- Winner of NIST blockcipher competition in 2000
- Now, standardized and very widely used

- Developed by Vincent Rijmen and Joan Daemen
- Winner of NIST blockcipher competition in 2000
- Now, standardized and very widely used
- Hardware support (e.g., AES-NI) makes this very fast: 10⁸ per second

- Developed by Vincent Rijmen and Joan Daemen
- Winner of NIST blockcipher competition in 2000
- Now, standardized and very widely used
- Hardware support (e.g., AES-NI) makes this very fast: 10⁸ per second
- This is the right block-cipher to use for most applications

Available Versions: $\ell=128(16 \text{ Bytes}), n=128, 192, 256$

Available Versions: $\ell = 128(16 \text{ Bytes}), n = 128, 192, 256$

• Change key schedule for different key lengths

Available Versions: $\ell = 128(16 \text{ Bytes}), n = 128, 192, 256$

- Change key schedule for different key lengths
- 10 rounds for 128-bit key, 12 rounds for 192-bit key, 14 rounds for 256-bit key

Available Versions: $\ell = 128(16 \text{ Bytes}), n = 128, 192, 256$

- Change key schedule for different key lengths
- 10 rounds for 128-bit key, 12 rounds for 192-bit key, 14 rounds for 256-bit key

State: 4×4 array of Bytes

$$\begin{pmatrix}
B_{11} & B_{12} & B_{13} & B_{14} \\
B_{21} & B_{22} & B_{23} & B_{24} \\
B_{31} & B_{32} & B_{33} & B_{34} \\
B_{41} & B_{42} & B_{43} & B_{44}
\end{pmatrix}$$

1 Add Round Key: View $k_i = k_{11} ||k_{12}|| \cdots ||k_{44}|$ with $|k_{ij}| = 1$ Byte

$$\begin{pmatrix} B_{11} \oplus k_{11} & B_{12} \oplus k_{12} & B_{13} \oplus k_{13} & B_{14} \oplus k_{14} \\ B_{21} \oplus k_{21} & B_{22} \oplus k_{22} & B_{23} \oplus k_{23} & B_{24} \oplus k_{24} \\ B_{31} \oplus k_{31} & B_{32} \oplus k_{32} & B_{33} \oplus k_{33} & B_{34} \oplus k_{34} \\ B_{41} \oplus k_{41} & B_{42} \oplus k_{42} & B_{43} \oplus k_{43} & B_{44} \oplus k_{44} \end{pmatrix}$$

4 Add Round Key: View $k_i = k_{11} ||k_{12}|| \cdots ||k_{44}|$ with $|k_{ij}| = 1$ Byte

$$\begin{pmatrix} B_{11} \oplus k_{11} & B_{12} \oplus k_{12} & B_{13} \oplus k_{13} & B_{14} \oplus k_{14} \\ B_{21} \oplus k_{21} & B_{22} \oplus k_{22} & B_{23} \oplus k_{23} & B_{24} \oplus k_{24} \\ B_{31} \oplus k_{31} & B_{32} \oplus k_{32} & B_{33} \oplus k_{33} & B_{34} \oplus k_{34} \\ B_{41} \oplus k_{41} & B_{42} \oplus k_{42} & B_{43} \oplus k_{43} & B_{44} \oplus k_{44} \end{pmatrix}$$

SubBytes: Uses a single 8-bit S-box

$$\begin{pmatrix} S(B_{11}) & S(B_{12}) & S(B_{13}) & S(B_{14}) \\ S(B_{21}) & S(B_{22}) & S(B_{23}) & S(B_{24}) \\ S(B_{31}) & S(B_{32}) & S(B_{33}) & S(B_{34}) \\ S(B_{41}) & S(B_{42}) & S(B_{43}) & S(B_{44}) \end{pmatrix}$$

Shift Rows: Shift each row to the left by varying amounts

$$\begin{pmatrix} B_{11} & B_{12} & B_{13} & B_{14} & (0 \text{ shift}) \\ B_{22} & B_{23} & B_{24} & B_{21} & (1 \text{ shift}) \\ B_{33} & B_{34} & B_{31} & B_{32} & (2 \text{ shift}) \\ B_{44} & B_{41} & B_{42} & B_{43} & (3 \text{ shift}) \end{pmatrix}$$

Shift Rows: Shift each row to the left by varying amounts

$$\begin{pmatrix} B_{11} & B_{12} & B_{13} & B_{14} & (0 \text{ shift}) \\ B_{22} & B_{23} & B_{24} & B_{21} & (1 \text{ shift}) \\ B_{33} & B_{34} & B_{31} & B_{32} & (2 \text{ shift}) \\ B_{44} & B_{41} & B_{42} & B_{43} & (3 \text{ shift}) \end{pmatrix}$$

MixColumns: Apply invertible transformation to Bytes in each column

Shift Rows: Shift each row to the left by varying amounts

$$\begin{pmatrix} B_{11} & B_{12} & B_{13} & B_{14} & (0 \text{ shift}) \\ B_{22} & B_{23} & B_{24} & B_{21} & (1 \text{ shift}) \\ B_{33} & B_{34} & B_{31} & B_{32} & (2 \text{ shift}) \\ B_{44} & B_{41} & B_{42} & B_{43} & (3 \text{ shift}) \end{pmatrix}$$

MixColumns: Apply invertible transformation to Bytes in each column

Observations:

Shift Rows: Shift each row to the left by varying amounts

$$\begin{pmatrix} B_{11} & B_{12} & B_{13} & B_{14} & (0 \text{ shift}) \\ B_{22} & B_{23} & B_{24} & B_{21} & (1 \text{ shift}) \\ B_{33} & B_{34} & B_{31} & B_{32} & (2 \text{ shift}) \\ B_{44} & B_{41} & B_{42} & B_{43} & (3 \text{ shift}) \end{pmatrix}$$

MixColumns: Apply invertible transformation to Bytes in each column

Observations:

Steps 3 and 4 correspond to permutation step

Shift Rows: Shift each row to the left by varying amounts

$$\begin{pmatrix} B_{11} & B_{12} & B_{13} & B_{14} & (0 \text{ shift}) \\ B_{22} & B_{23} & B_{24} & B_{21} & (1 \text{ shift}) \\ B_{33} & B_{34} & B_{31} & B_{32} & (2 \text{ shift}) \\ B_{44} & B_{41} & B_{42} & B_{43} & (3 \text{ shift}) \end{pmatrix}$$

MixColumns: Apply invertible transformation to Bytes in each column

Observations:

- Steps 3 and 4 correspond to permutation step
- Even this very structured permutation seems enough

Outline

- 1 Lecture 15 Review
- 2 AES Review
- 3 Feistel Networks and DES (Chapters 6.2.2-6.2.4)
- 4 Building Collision-Resistant Hash Functions (Chapter 6.3.1)

A different approach to building block ciphers:

A different approach to building block ciphers:

• SPN used small (1-Byte) permutations (S-boxes)

A different approach to building block ciphers:

- SPN used small (1-Byte) permutations (S-boxes)
- Feistel instead uses functions $f_i: \{0,1\}^{\ell/2} \to \{0,1\}^{\ell/2}$

A different approach to building block ciphers:

- SPN used small (1-Byte) permutations (S-boxes)
- Feistel instead uses functions $f_i: \{0,1\}^{\ell/2} \to \{0,1\}^{\ell/2}$
 - These f_i do not need to be invertible (not permutations)

A different approach to building block ciphers:

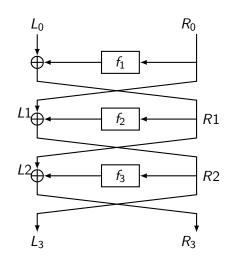

- SPN used small (1-Byte) permutations (S-boxes)
- Feistel instead uses functions $f_i: \{0,1\}^{\ell/2} \to \{0,1\}^{\ell/2}$
 - These f_i do not need to be invertible (not permutations)
 - Allows the f_i to have "less structure"

A different approach to building block ciphers:

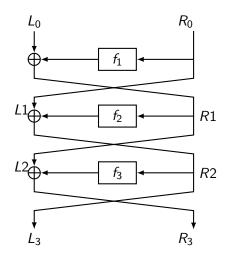

- SPN used small (1-Byte) permutations (S-boxes)
- Feistel instead uses functions $f_i: \{0,1\}^{\ell/2} \to \{0,1\}^{\ell/2}$
 - These f_i do not need to be invertible (not permutations)
 - Allows the f_i to have "less structure"

The Challenge

How do we use such f_i to build an invertible function?

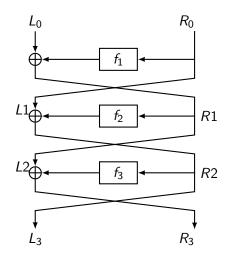

Evaluating round i:

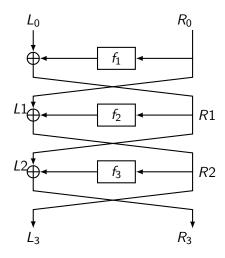

Evaluating round *i*:

• Split input in half: $L_{i-1}||R_{i-1}||$

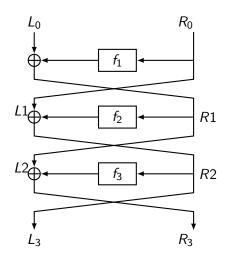

Evaluating round i:

- Split input in half: $L_{i-1}||R_{i-1}||$
- $L_i = R_{i-1}$

Evaluating round *i*:

- Split input in half: $L_{i-1}||R_{i-1}||$
- $L_i = R_{i-1}$
- $\bullet \ R_i = L_{i-1} \oplus f_i(R_{i-1})$

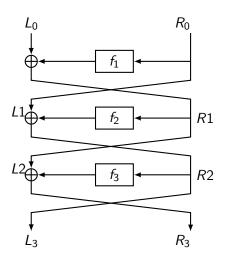

11/22

Evaluating round *i*:

- Split input in half: $L_{i-1}||R_{i-1}||$
- $L_i = R_{i-1}$
- $\bullet \ R_i = L_{i-1} \oplus f_i(R_{i-1})$

Inverting round *i*:

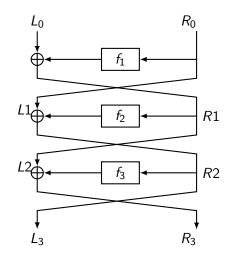

11/22

Evaluating round *i*:

- Split input in half: $L_{i-1}||R_{i-1}||$
- $L_i = R_{i-1}$
- $\bullet \ R_i = L_{i-1} \oplus f_i(R_{i-1})$

Inverting round *i*:

• Set $R_{i-1} = L_i$

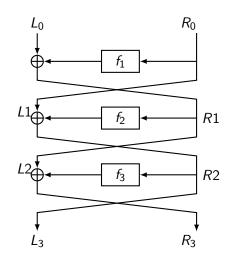

Evaluating round *i*:

- Split input in half: $L_{i-1}||R_{i-1}||$
- $L_i = R_{i-1}$
- $\bullet R_i = L_{i-1} \oplus f_i(R_{i-1})$

Inverting round *i*:

- Set $R_{i-1} = L_i$
- $\bullet \ \mathsf{Set} \ L_{i-1} = R_i \oplus f_i(R_{i-1})$

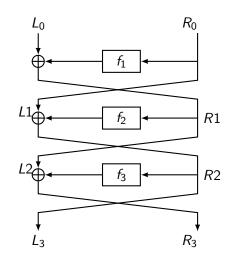

Evaluating round *i*:

- Split input in half: $L_{i-1}||R_{i-1}||$
- $L_i = R_{i-1}$
- $\bullet R_i = L_{i-1} \oplus f_i(R_{i-1})$

Inverting round *i*:

- Set $R_{i-1} = L_i$
- Set $L_{i-1} = R_i \oplus f_i(R_{i-1})$

Round Functions:

11 / 22

Evaluating round *i*:

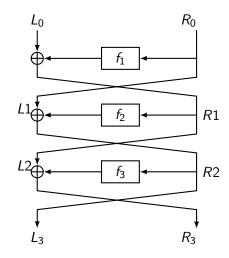

- Split input in half: $L_{i-1}||R_{i-1}||$
- $L_i = R_{i-1}$
- $\bullet R_i = L_{i-1} \oplus f_i(R_{i-1})$

Inverting round *i*:

- Set $R_{i-1} = L_i$
- Set $L_{i-1} = R_i \oplus f_i(R_{i-1})$

Round Functions:

Each round has function f_i

11 / 22

Evaluating round *i*:

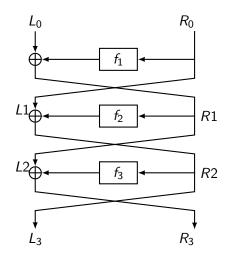

- Split input in half: $L_{i-1}||R_{i-1}||$
- $L_i = R_{i-1}$
- $\bullet R_i = L_{i-1} \oplus f_i(R_{i-1})$

Inverting round *i*:

- Set $R_{i-1} = L_i$
- Set $L_{i-1} = R_i \oplus f_i(R_{i-1})$

Round Functions:

- Each round has function f_i
- f_i does not have to be invertible

Evaluating round *i*:

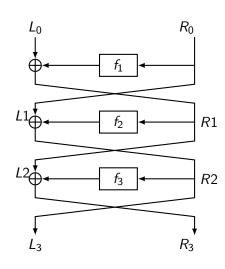

- Split input in half: $L_{i-1}||R_{i-1}||$
- $L_i = R_{i-1}$
- $\bullet R_i = L_{i-1} \oplus f_i(R_{i-1})$

Inverting round i:

- Set $R_{i-1} = L_i$
- Set $L_{i-1} = R_i \oplus f_i(R_{i-1})$

Round Functions:

- Each round has function f_i
- f_i does not have to be invertible
- Usually f_i derived from global public f and round key k_i

11/22

- Developed in 1970s by IBM + NSA
 - Used techniques not publicly known at the time

Arkady Yerukhimovich Cryptography October 23, 2024 12 / 22

- Developed in 1970s by IBM + NSA
 - Used techniques not publicly known at the time
- 16-round Feistel network with $\ell=64$ (block length) and n=56 (key length)

- Developed in 1970s by IBM + NSA
 - Used techniques not publicly known at the time
- 16-round Feistel network with $\ell = 64$ (block length) and n = 56 (key length)
- There are no known successful cryptanalytic attacks on DES

- Developed in 1970s by IBM + NSA
 - Used techniques not publicly known at the time
- 16-round Feistel network with $\ell = 64$ (block length) and n = 56 (key length)
- There are no known successful cryptanalytic attacks on DES
- But, n = 56 is too short, can be brute-forced on today's computers

- Developed in 1970s by IBM + NSA
 - Used techniques not publicly known at the time
- 16-round Feistel network with $\ell = 64$ (block length) and n = 56 (key length)
- There are no known successful cryptanalytic attacks on DES
- But, n = 56 is too short, can be brute-forced on today's computers
- We will talk about how to extend the key later

DES Key Schedule: Choosing round keys k_i from master key k

Arkady Yerukhimovich Cryptography October 23, 2024 13 / 22

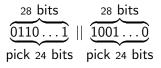

DES Key Schedule: Choosing round keys k_i from master key k

• $k \in \{0,1\}^{56}$, $k_i \in \{0,1\}^{48}$

Arkady Yerukhimovich

DES Key Schedule: Choosing round keys k_i from master key k

- $k \in \{0,1\}^{56}$, $k_i \in \{0,1\}^{48}$
- Each k_i is a subset of bits of k

DES Key Schedule: Choosing round keys k_i from master key k

- $k \in \{0,1\}^{56}$, $k_i \in \{0,1\}^{48}$
- Each k_i is a subset of bits of k

$$\underbrace{0110\dots1}_{\text{pick 24 bits}} || \underbrace{1001\dots0}_{\text{pick 24 bits}}$$

• Which bits chosen in each round is public

Arkady Yerukhimovich

DES round function f_i :

DES round function f_i :

•
$$f_i(R) = \hat{f}(k_i, R), k_i \in \{0, 1\}^{48}, R \in \{0, 1\}^{32}$$

Arkady Yerukhimovich Cryptography October 23, 2024 14 / 22

DES round function f_i :

- $f_i(R) = \hat{f}(k_i, R), k_i \in \{0, 1\}^{48}, R \in \{0, 1\}^{32}$
- Same \hat{f} used in all 16 rounds

Arkady Yerukhimovich Cryptography October 23, 2024 14/22

DES round function f_i :

- $f_i(R) = \hat{f}(k_i, R), k_i \in \{0, 1\}^{48}, R \in \{0, 1\}^{32}$
- Same \hat{f} used in all 16 rounds
- $f \hat{f}$ is a substitution-permutation network (SPN)

Arkady Yerukhimovich

DES round function f_i :

- $f_i(R) = \hat{f}(k_i, R), k_i \in \{0, 1\}^{48}, R \in \{0, 1\}^{32}$
- Same \hat{f} used in all 16 rounds
- $f \hat{f}$ is a substitution-permutation network (SPN)

Constructing f_i :

DES round function f_i :

- $f_i(R) = \hat{f}(k_i, R), k_i \in \{0, 1\}^{48}, R \in \{0, 1\}^{32}$
- Same \hat{f} used in all 16 rounds
- $f \hat{f}$ is a substitution-permutation network (SPN)

Constructing f_i :

• Extend R to 48 bits by duplicating half of the bits of R: R' = E(R)

DES round function f_i :

- $f_i(R) = \hat{f}(k_i, R), k_i \in \{0, 1\}^{48}, R \in \{0, 1\}^{32}$
- Same \hat{f} used in all 16 rounds
- $f \hat{f}$ is a substitution-permutation network (SPN)

Constructing f_i :

- **1** Extend R to 48 bits by duplicating half of the bits of R: R' = E(R)
- ② Key mixing $-R'' = R' \oplus k_i$

DES round function f_i :

- $f_i(R) = \hat{f}(k_i, R), k_i \in \{0, 1\}^{48}, R \in \{0, 1\}^{32}$
- Same \hat{f} used in all 16 rounds
- $f \hat{f}$ is a substitution-permutation network (SPN)

Constructing f_i :

- **1** Extend R to 48 bits by duplicating half of the bits of R: R' = E(R)
- ② Key mixing $-R'' = R' \oplus k_i$
- Substitution
 - Break R" into 8 blocks of 6 bits
 - Pass each block through different S-box (6-bit to 4-bit) (not invertible)

DES round function f_i :

- $f_i(R) = \hat{f}(k_i, R), k_i \in \{0, 1\}^{48}, R \in \{0, 1\}^{32}$
- Same \hat{f} used in all 16 rounds
- $f \hat{f}$ is a substitution-permutation network (SPN)

Constructing f_i :

- **1** Extend R to 48 bits by duplicating half of the bits of R: R' = E(R)
- ② Key mixing $-R'' = R' \oplus k_i$
- Substitution
 - Break R" into 8 blocks of 6 bits
 - Pass each block through different S-box (6-bit to 4-bit) (not invertible)
- Permutation
 - Apply mixing permutation to 32-bit output

◆ロト ◆団 ト ◆ 豆 ト ◆ 豆 ・ 夕 Q (*)

DES round function f_i :

DES S-Boxes:

Arkady Yerukhimovich Cryptography October 23, 2024 15 / 22

DES S-Boxes:

• DES has 8 S-Boxes, each taking 6-bits to 4-bits

DES S-Boxes:

- DES has 8 S-Boxes, each taking 6-bits to 4-bits
- These S-Boxes are very carefully designed to resist cryptanalysis

DES S-Boxes:

- DES has 8 S-Boxes, each taking 6-bits to 4-bits
- These S-Boxes are very carefully designed to resist cryptanalysis
- Each S-Box is 4-to-1

DES S-Boxes:

- DES has 8 S-Boxes, each taking 6-bits to 4-bits
- These S-Boxes are very carefully designed to resist cryptanalysis
- Each S-Box is 4-to-1
- Changing 1 bit of input changes ≥ 2 bits of output

DES S-Boxes:

- DES has 8 S-Boxes, each taking 6-bits to 4-bits
- These S-Boxes are very carefully designed to resist cryptanalysis
- Each S-Box is 4-to-1
- Changing 1 bit of input changes ≥ 2 bits of output

Mixing Permutation:

DES S-Boxes:

- DES has 8 S-Boxes, each taking 6-bits to 4-bits
- These S-Boxes are very carefully designed to resist cryptanalysis
- Each S-Box is 4-to-1
- Changing 1 bit of input changes ≥ 2 bits of output

Mixing Permutation:

Output from any S-Box, affects input to 6 S-Boxes in next round

DES Avalanche Effect

- After 7 rounds all 32 bits in R affected
- After 8 rounds all 32 bits in L affected

Increasing Key Length

• Recall that DES had a key that was too short (n = 56)

Arkady Yerukhimovich Cryptography Octo

Increasing Key Length

- Recall that DES had a key that was too short (n = 56)
- It is possible to brute-force DES by trying all possible keys

Arkady Yerukhimovich Cryptography October 23, 2024 17 / 22

Increasing Key Length

- Recall that DES had a key that was too short (n = 56)
- It is possible to brute-force DES by trying all possible keys

Question

How can we increase the key length of a block cipher?

Double Encryption

Try 1: Double Encryption (2DES) – double the key size

$$F'_{k_1,k_2}(x) = F_{k_2}(F_{k_1}(x))$$

Arkady Yerukhimovich Cryptography October 23, 2024 18 / 22

Double Encryption

Try 1: Double Encryption (2DES) – double the key size

$$F'_{k_1,k_2}(x) = F_{k_2}(F_{k_1}(x))$$

Meet-in-the-middle Attack: Recovers key in time 2^n

Arkady Yerukhimovich

Try 1: Double Encryption (2DES) – double the key size

$$F'_{k_1,k_2}(x) = F_{k_2}(F_{k_1}(x))$$

Meet-in-the-middle Attack: Recovers key in time 2^n

$$\mathcal{A}$$
 gets (x, y) such that $y = F'_{k_1^*, k_2^*}(x) = F_{k_2^*}(F_{k_1^*}(x))$

Arkady Yerukhimovich Cryptography October 23, 2024 18 / 22

Try 1: Double Encryption (2DES) – double the key size

$$F'_{k_1,k_2}(x) = F_{k_2}(F_{k_1}(x))$$

Meet-in-the-middle Attack: Recovers key in time 2^n

$${\mathcal A}$$
 gets (x,y) such that $y=F'_{k_1^*,k_2^*}(x)=F_{k_2^*}(F_{k_1^*}(x))$

• For each $k_1 \in \{0,1\}^n$, compute $z = F_{k_1}(x)$, store (z,k_1) in table L

Arkady Yerukhimovich

Try 1: Double Encryption (2DES) – double the key size

$$F'_{k_1,k_2}(x) = F_{k_2}(F_{k_1}(x))$$

Meet-in-the-middle Attack: Recovers key in time 2^n

$${\mathcal A}$$
 gets (x,y) such that $y=F'_{k_1^*,k_2^*}(x)=F_{k_2^*}(F_{k_1^*}(x))$

- For each $k_1 \in \{0,1\}^n$, compute $z = F_{k_1}(x)$, store (z,k_1) in table L
- ② For each $k_2 \in \{0,1\}^n$, compute $z = F_{k_2}^{-1}(y)$, store (z,k_2) in table L'

Arkady Yerukhimovich

Try 1: Double Encryption (2DES) – double the key size

$$F'_{k_1,k_2}(x) = F_{k_2}(F_{k_1}(x))$$

Meet-in-the-middle Attack: Recovers key in time 2^n

$${\mathcal A}$$
 gets (x,y) such that $y=F'_{k_1^*,k_2^*}(x)=F_{k_2^*}(F_{k_1^*}(x))$

- For each $k_1 \in \{0,1\}^n$, compute $z = F_{k_1}(x)$, store (z,k_1) in table L
- ② For each $k_2 \in \{0,1\}^n$, compute $z = F_{k_2}^{-1}(y)$, store (z,k_2) in table L'
- **3** Find all intersections s.t. $z_1 \in L = z_2 \in L'$ add (k_1, k_2) to table S

Try 1: Double Encryption (2DES) – double the key size

$$F'_{k_1,k_2}(x) = F_{k_2}(F_{k_1}(x))$$

Meet-in-the-middle Attack: Recovers key in time 2^n

$${\mathcal A}$$
 gets (x,y) such that $y=F'_{k_1^*,k_2^*}(x)=F_{k_2^*}(F_{k_1^*}(x))$

- For each $k_1 \in \{0,1\}^n$, compute $z = F_{k_1}(x)$, store (z,k_1) in table L
- ② For each $k_2 \in \{0,1\}^n$, compute $z = F_{k_2}^{-1}(y)$, store (z,k_2) in table L'
- **3** Find all intersections s.t. $z_1 \in L = z_2 \in L'$ add (k_1, k_2) to table S

Observations:

• For any such k_1, k_2 , we know that $F_{k_1}(x) = F_{k_2}^{-1}(y)$, so k_1, k_2 is a possible key for (x, y)

◆ロト ◆個ト ◆差ト ◆差ト 差 めなべ

Try 1: Double Encryption (2DES) – double the key size

$$F'_{k_1,k_2}(x) = F_{k_2}(F_{k_1}(x))$$

Meet-in-the-middle Attack: Recovers key in time 2^n

$$\mathcal{A}$$
 gets (x,y) such that $y = F'_{k_1^*,k_2^*}(x) = F_{k_2^*}(F_{k_1^*}(x))$

- For each $k_1 \in \{0,1\}^n$, compute $z = F_{k_1}(x)$, store (z,k_1) in table L
- ② For each $k_2 \in \{0,1\}^n$, compute $z = F_{k_2}^{-1}(y)$, store (z,k_2) in table L'
- **3** Find all intersections s.t. $z_1 \in L = z_2 \in L'$ add (k_1, k_2) to table S

Observations:

- For any such k_1, k_2 , we know that $F_{k_1}(x) = F_{k_2}^{-1}(y)$, so k_1, k_2 is a possible key for (x, y)
- Using a few more (x, y) pairs can uniquely identify k_1^*, k_2^* whp.

Try 1: Double Encryption (2DES) – double the key size

$$F'_{k_1,k_2}(x) = F_{k_2}(F_{k_1}(x))$$

Meet-in-the-middle Attack: Recovers key in time 2^n

$$\mathcal{A}$$
 gets (x,y) such that $y = F'_{k_1^*,k_2^*}(x) = F_{k_2^*}(F_{k_1^*}(x))$

- For each $k_1 \in \{0,1\}^n$, compute $z = F_{k_1}(x)$, store (z,k_1) in table L
- ② For each $k_2 \in \{0,1\}^n$, compute $z = F_{k_2}^{-1}(y)$, store (z,k_2) in table L'
- **3** Find all intersections s.t. $z_1 \in L = z_2 \in L'$ add (k_1, k_2) to table S

- For any such k_1, k_2 , we know that $F_{k_1}(x) = F_{k_2}^{-1}(y)$, so k_1, k_2 is a possible key for (x, y)
- Using a few more (x, y) pairs can uniquely identify k_1^*, k_2^* whp.
- This attack takes $O(2^n)$ time, so we are no better off than we were with just single encryption.

Triple encryption with 3 keys

$$F_{k_1,k_2,k_3}^{"}(x) = F_{k_3}(F_{k_2}^{-1}(F_{k_1}(x)))$$

Arkady Yerukhimovich

Triple encryption with 3 keys

$$F_{k_1,k_2,k_3}^{"}(x) = F_{k_3}(F_{k_2}^{-1}(F_{k_1}(x)))$$

2 Triple encryption with 2 keys

$$F_{k_1,k_2}''(x) = F_{k_1}(F_{k_2}^{-1}(F_{k_1}(x)))$$

Triple encryption with 3 keys

$$F_{k_1,k_2,k_3}^{"}(x) = F_{k_3}(F_{k_2}^{-1}(F_{k_1}(x)))$$

2 Triple encryption with 2 keys

$$F_{k_1,k_2}''(x) = F_{k_1}(F_{k_2}^{-1}(F_{k_1}(x)))$$

Observations:

• Second call to F_k is reversed for backward compatibility: $F_{k_1,k_1,k_1}'' = F_{k_1}$

Triple encryption with 3 keys

$$F_{k_1,k_2,k_3}^{"}(x) = F_{k_3}(F_{k_2}^{-1}(F_{k_1}(x)))$$

Triple encryption with 2 keys

$$F_{k_1,k_2}''(x) = F_{k_1}(F_{k_2}^{-1}(F_{k_1}(x)))$$

- Second call to F_k is reversed for backward compatibility: $F_{k_1,k_1,k_1}'' = F_{k_1}$
- Both variants have 2^{2n} security (this is good enough, 112-bits)

Triple encryption with 3 keys

$$F_{k_1,k_2,k_3}^{"}(x) = F_{k_3}(F_{k_2}^{-1}(F_{k_1}(x)))$$

2 Triple encryption with 2 keys

$$F_{k_1,k_2}''(x) = F_{k_1}(F_{k_2}^{-1}(F_{k_1}(x)))$$

- Second call to F_k is reversed for backward compatibility: $F_{k_1,k_1,k_1}'' = F_{k_1}$
- Both variants have 2^{2n} security (this is good enough, 112-bits)
- In 3-key version, can still do meet-in-the-middle, but takes $O(2^{2n})$ keys to do it

Triple encryption with 3 keys

$$F_{k_1,k_2,k_3}^{"}(x) = F_{k_3}(F_{k_2}^{-1}(F_{k_1}(x)))$$

2 Triple encryption with 2 keys

$$F_{k_1,k_2}''(x) = F_{k_1}(F_{k_2}^{-1}(F_{k_1}(x)))$$

- Second call to F_k is reversed for backward compatibility: $F''_{k_1,k_1,k_1} = F_{k_1}$
- Both variants have 2^{2n} security (this is good enough, 112-bits)
- In 3-key version, can still do meet-in-the-middle, but takes $O(2^{2n})$ keys to do it
- In 2-key version, meet-in-the-middle still takes $O(2^{2n})$ time, but can also do enumeration of keys in $O(2^{2n})$ time

Outline

- 1 Lecture 15 Review
- 2 AES Review
- 3 Feistel Networks and DES (Chapters 6.2.2-6.2.4)
- 4 Building Collision-Resistant Hash Functions (Chapter 6.3.1)

Arkady Yerukhimovich

Collision-resistant hash function from an (ideal) block-cipher:

Arkady Yerukhimovich Cryptography October 23, 2024 21/22

Collision-resistant hash function from an (ideal) block-cipher:

• We build a compression function: $h:\{0,1\}^{n+\ell} \to \{0,1\}^{\ell}$ from block cipher with n-bit key and ℓ -bit block

Collision-resistant hash function from an (ideal) block-cipher:

- We build a compression function: $h:\{0,1\}^{n+\ell} \to \{0,1\}^\ell$ from block cipher with n-bit key and ℓ -bit block
- Can turn this into arbitrary length hash (Merkle-Damgård)

Collision-resistant hash function from an (ideal) block-cipher:

- We build a compression function: $h:\{0,1\}^{n+\ell} \to \{0,1\}^\ell$ from block cipher with n-bit key and ℓ -bit block
- Can turn this into arbitrary length hash (Merkle-Damgård)

Davies-Meyer Construction

Collision-resistant hash function from an (ideal) block-cipher:

- We build a compression function: $h:\{0,1\}^{n+\ell} \to \{0,1\}^\ell$ from block cipher with n-bit key and ℓ -bit block
- Can turn this into arbitrary length hash (Merkle-Damgård)

Davies-Meyer Construction

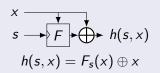

$$\begin{array}{ccc}
x & & & \\
s & & & F & & h(s, x) \\
h(s, x) & = F_s(x) \oplus x
\end{array}$$

Properties:

Collision-resistant hash function from an (ideal) block-cipher:

- We build a compression function: $h:\{0,1\}^{n+\ell} \to \{0,1\}^\ell$ from block cipher with n-bit key and ℓ -bit block
- Can turn this into arbitrary length hash (Merkle-Damgård)

Davies-Meyer Construction

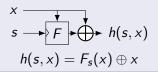

Properties:

Not known how to prove this secure based on F being a strong PRP

Collision-resistant hash function from an (ideal) block-cipher:

- We build a compression function: $h:\{0,1\}^{n+\ell} \to \{0,1\}^\ell$ from block cipher with n-bit key and ℓ -bit block
- Can turn this into arbitrary length hash (Merkle-Damgård)

Davies-Meyer Construction

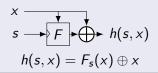

Properties:

- Not known how to prove this secure based on F being a strong PRP
- Can prove secure if F is modeled as an ideal cipher
 - Randomly chosen cipher guaranteeing decryption correctness

Collision-resistant hash function from an (ideal) block-cipher:

- We build a compression function: $h:\{0,1\}^{n+\ell} \to \{0,1\}^\ell$ from block cipher with n-bit key and ℓ -bit block
- Can turn this into arbitrary length hash (Merkle-Damgård)

Davies-Meyer Construction

Properties:

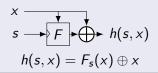

- Not known how to prove this secure based on F being a strong PRP
- Can prove secure if F is modeled as an ideal cipher
 - Randomly chosen cipher guaranteeing decryption correctness
 - Such a cipher has very strong security properties

4□ > 4□ > 4□ > 4 = > 4 = > = 900

Collision-resistant hash function from an (ideal) block-cipher:

- We build a compression function: $h:\{0,1\}^{n+\ell} \to \{0,1\}^\ell$ from block cipher with n-bit key and ℓ -bit block
- Can turn this into arbitrary length hash (Merkle-Damgård)

Davies-Meyer Construction

Properties:

- Not known how to prove this secure based on F being a strong PRP
- Can prove secure if F is modeled as an ideal cipher
 - Randomly chosen cipher guaranteeing decryption correctness
 - Such a cipher has very strong security properties
- Insecure if instantiated with DES

Collision-resistant hash function from an (ideal) block-cipher:

- We build a compression function: $h:\{0,1\}^{n+\ell} \to \{0,1\}^\ell$ from block cipher with n-bit key and ℓ -bit block
- Can turn this into arbitrary length hash (Merkle-Damgård)

Davies-Meyer Construction

$$x \xrightarrow{s} F \xrightarrow{\bullet} h(s,x)$$

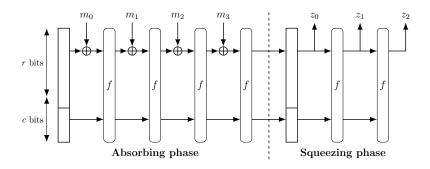

$$h(s,x) = F_s(x) \oplus x$$

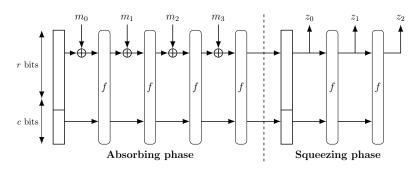

Properties:

- Not known how to prove this secure based on F being a strong PRP
- Can prove secure if F is modeled as an ideal cipher
 - Randomly chosen cipher guaranteeing decryption correctness
 - Such a cipher has very strong security properties
- Insecure if instantiated with DES
- But, there are block-ciphers for which this is believed to be secure sec

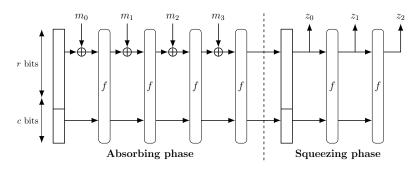

21 / 22

Arkady Yerukhimovich Cryptography October 23, 2024

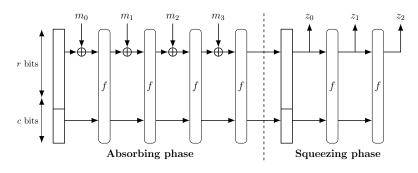

- More general than a hash function
 - Can have arbitrary length output
 - Can be used to build block-cipher, MAC, PRG, etc.

- More general than a hash function
 - Can have arbitrary length output
 - Can be used to build block-cipher, MAC, PRG, etc.
- Uses a b-bit permutation f with b = r + c
 - r − rate
 - *c* security parameter

- More general than a hash function
 - Can have arbitrary length output
 - Can be used to build block-cipher, MAC, PRG, etc.
- Uses a *b*-bit permutation f with b = r + c
 - r rate
 - c security parameter
- Looks like a random function if f is random permutation
